

TOYOPEARL GigaCap® Series

INTRODUCTION

Ion Exchange Chromatography (IEC) is one of the most frequently used chromatographic modes for the separation and purification of biomolecules. Compared with other chromatographic modes, modern ion exchange media offer high dynamic binding capacities and a straightforward method development. IEC is used at all stages and scales of purification of therapeutic proteins: from laboratory scale purification to industrial scale downstream processing (DSP).

The development of cell lines with high expression levels has triggered the demand for high throughput DSP. This requires rigid resins that offer high binding capacities and recoveries at high flow rates and withstand harsh purification procedures. TOYOPEARL GigaCap ion exchange resins were developed to meet the actual needs in high throughput purification of monoclonal antibodies and other proteins by packed bed chromatography.

The TOYOPEARL GigaCap family consists of two cation exchange resins - GigaCap S-650 and GigaCap CM-650 - and the GigaCap Q-650 and DEAE-650 anion exchange resins. While all GigaCap media are available in M-grade particle size (75 μ m) for capture and intermediate process steps, GigaCap S and Q are also available in smaller particle size (S-grade; 35 μ m) for high resolution intermediate and polishing purification.

STATIC VS DYNAMIC BINDING CAPACITIES FOR HUMAN IgG

Figure 1 DBC for GigaCap S-650M calculated at 10% breakthrough Column size: 6 mm ID x 4 cm L; Sample: polyclonal human IgG; Linear velocity: 212 cm/h

HIGHLIGHTS

- High binding capacities at short residence times
- Fast elution kinetics generating low elution pool volumes
- Excellent mechanical and chemical stability
- Superior pressure flow properties

TOYOPEARL GigaCap S-650

Toyopearl GigaCap S-650 is a strong cation exchange resin designed for high throughput process chromatography. Based on the well proven methacrylic polymer back-bone of Toyopearl and TSKgel media Toyopearl GigaCap S combines excellent pressure flow characteristics (Figure 5)recoveries for a wide range of biomolecules. Latest surface modification technology was applied to increase the content of functional groups at the particle surface thus reaching binding capacities up to 150 mg IgG per mL resin (Figure 1, 2). Similar binding capacities can be achieved for smaller proteins such as insulin (Figure 3).

Figure 2

DBC for GigaCap S-650M calculated at 10% breakthrough Column size: 6 mm ID x 4 cm L bed height;

Sample: Polyclonal human IgG (1 mg/mL); Buffer: 0.1 mol/L acetate buffer (pH 4.7); Linear velocity: 212, 424, 636, 1060 cm/h; Detection: UV @ 280 nm

TOYOPEARL GigaCap S-650M BREAKTHROUGH CURVES AT DIFFERENT LINEAR VELOCITIES

TOYOPEARL DYNAMIC BINDING CAPACITIES FOR INSULIN

Figure 3 Column size: 6.6 mm ID x 22 mm L; 100 mM citrate buffer (ph 3.0)

The applied ligand chemistry enables a better access of proteins to the charged groups. Besides binding capacity this improves also mass transfer and thereby reduces the target molecule elution volume.

Figure 4 shows the breakthrough curve for Toyopearl GigaCap S compared with the most equivalent competitive resin. Each trace shows the dynamic binding capacity of the resin up to 10% breakthrough plus the elution profile. Elution pool volume of Toyopearl GigaCap S is remarkably reduced when compared to the competitive resin. The concentration of the eluted protein is proportionally increased as well. It is possible to achieve reductions in elution pool volumes of over 75% (Jackewitz A. BioProcess Int. 6 (7) 2008: 108-110). This has potentially very significant impact on reducing the cost of further downstream process steps. Similar reductions of elution pool volumes can be reached with all GigaCap resins.

Toyopearl GigaCap S shows an excellent chemical sta- bility

REDUCED POOL VOLUME

Column: TOYOPEARL GigaCap S-650M, 6 mm ID x 4 cm; Loading buffer: 0.1 mol/L acetate buffer pH 4.7; Elution buffer: 0.1 mol/L acetate buffer pH 4.7 + 1.0 mol/L NaCl; Linear velocity: 212 cm/h; Detection: UV @ 280 nm; Sample: polyclonal human IgG (1 mg/mL)

Figure 5

resulting in a minimal loss of IgG binding capacity after exposure to 1 M NaOH (Table 1) for 5 weeks. It is therefore ideally suited for process scale protein purification in large industrial process columns.

The small particle size TOYOPEARL GigaCap S-650S offers a higher binding capacity and resolution than the M grade. It is ideally suited for high purity separations needed in final polishing steps. Figure 6 shows the high resolution achieved with TOYOPEARL GigaCap S-650S and its advantageous selectivity, when compared with agarose based cation exchange media with similar particle size.

Column: 7.5 mm ID x 7.5 cm; Buffer A: 0.02 mol/L phosphate buffer (pH 7.0), Buffer B: 0.02 mol/L phosphate buffer + 1.0 mol/L NaCl (pH 7.0); Flow rate: 1.0 mL/min; Gradient: 60 min linear from 100% buffer A to 100% buffer B; Detection: UV @ 280nm; Sample: 1. ribonuclease A (9.2 g/L), 2. cytocrome C (4.7 g/L), 3. lysozyme (9.5 g/L); Injection volume: 20 µL

TOYOPEARL GigaCap CM-650M

Toyopearl GigaCap CM-650M is a weak cation exchange resin that combines excellent pressure flow characteristics (Figure 5) and high alkaline stability (Table 2) with high dynamic binding capacities and recoveries for both, IgGs and smaller proteins. Latest surface modification technology was applied to increase the content of functional groups at the particle surface thus reaching binding capacities up to 100 mg IgG per mL resin (Figure 7).

Depending on the specific characteristics of the target molecule, GigaCap S-650M and CM-650M exhibit different selectivity as shown in Figure 8 for some standard proteins. Therefore it is strongly recommended to evaluate both, GigaCap CM-650M and S-650M when developing a cation exchange purification step. For fast resin screening all GigaCap 650M resins are available in 1 or 5 mL prepacked ToyoScreen columns.

Buffer A: 20 mM Phosphate (pH 7.0); Buffer B: 20 mM Phosphate + 1.0 M NaCl (pH 7.0); Gradient: 60 min linear gradient from 100% A to 100% B; Injection Volume: 25 μ L; Detection: UV @ 280 nm;

Sample: (a) 1. ribonuclease A (5.0 mg/mL), 2. cytochrome C (1.9 mg/mL), 3. lysozyme (3.8 mg/mL);

(b) 1. trypsinogen (3.8 mg/mL), 2. ribonuclease A (5.0 mg/mL), 3. lysozyme (3.8 mg/mL)

TOYOPEARL GigaCap Q-650

Toyopearl GigaCap Q-650 is a strong anion exchange resin. It combines excellent pressure flow characteristics (Figure 9) with high dynamic binding capacities and high recoveries for a broad range of proteins. It binds up to 175 mg BSA per mL resin at 212 cm/h and still 164 mg BSA per mL resin at a linear flow of 800 cm/h (Figure 10).

High dynamic binding capacities can be achieved for much larger proteins as well. Even for a very large protein like thyroglobulin a dynamic binding capacity of 49 mg/mL gel can be achieved.

Toyopearl GigaCap Q-650M is the ideal anion exchange resin for large scale DSP unit operations. Examples range from flow-through steps in antibody purification to bind-elute steps in plasma protein purification. In flow through steps, TOYOPEARL GigaCap Q-650M can provide a viral clearance of 4 logs for MVM virus and X-MuLV virus.

The small particle size TOYOPEARL GigaCap Q-650S (35 µm) offers a higher binding capacity (190 g BSA/L) and higher resolution than the respective M grade. The purification of oligonucleotides using anion exchange chromatography has traditionally fallen to resins such as TSKgel SuperQ-5PW (20) that offer high resolution and selectivity in conjunction with excellent mechanical stability at very high column pressures.

TOYOPEARL GigaCap Q-650S resin offers a low pressure alternative to oligonucleotide purification while preserving the selectivity, resolution and yields of those higher pressure processes. Figure 11 shows that the N-1 peak was slightly better resolved with the TSKgel SuperQ-5PW (20) than with the TOYOPEARL GigaCap Q-650S, perhaps due to the smaller particle size of the TSKgel resin. HPLC analysis of fractions taken across the peaks (data not shown) revealed that both resins were able to adequately resolve the full length oligonucleotide.

PRESSURE FLOW CURVES FOR ANION EXCHANGE RESINS

Column size: 2.2 mm ID x 20 mm; Mobile phase: Water

GigaCap Q BSA BINDING CAPACITY AT DIFFERENT FLOW RATES

DBC measured at 10 % breakthrough; Column size: 6 mm ID x 4 cm;

PURIFICATION OF OLIGONUCLEOTIDES

Sample: Bovine serum albumin (BSA 1 mg/mL) in Tris-HCL pH 8.5

Resin: TSKgel SuperQ-5PW (20); Column size: 6.6 mm ID × 18.5 cm (6.3 mL); Mobile phase: A: 20 mmol/L NaOH; B: 20 mmol/L NaOH, 3.0 mol/L NaCl; Gradient: 50% B (2 CV) 50-100% B (15 CV), 100% B (2 CV); Flow rate: 200 cm/ hr (1.14 mL/min); Detection: UV @ 254 nm; Sample load: 1.0 mg; Sample: crude phosphorothioate deoxyoligonucleotide

Resin: TOYOPEARL GigaCap Q-650S; Column size: 6.6 mm ID × 18.5 cm (6.3 mL); Mobile phase: A: 20 mmol/L NaOH, B: 20 mmol/L NaOH, 3.0 mol/L NaCI 50% B (2 CV); Gradient: 50-100% B (15 CV), 100% B (2 CV);

Flow rate: 200 cm/hr (1.14 mL/min); Detection: UV @ 254 nm; Sample load: 1.0 mg; Sample: crude phosphorothioate deoxyoligonucleotide

TOYOPEARL GigaCap DEAE-650

TOYOPEARL GigaCap DEAE-650M is a weak anion exchange resin for process scale applications. The polymeric base bead was chemically modified to provide a greater number of anionic binding sites, resulting in increased binding capacity. TOYOPEARL GigaCap DEAE-650M exhibits typical dynamic binding capacities (DBC) approaching 170 g/L for bovine serum albumin (BSA) and 100 g/L for IgG. It maintains high capacity across a range of linear velocities and exhibits excellent pressure-flow characteristics. The high capacity and low back pressure creates opportunities for increased throughput in various anion exchange purification steps and is ideally suited for efficient plasma protein purification.

DBC OF TOYOPEARL GigaCap DEAE-650M AT DIFFERENT FLOW-RATES

DBC was determined at 10% breakthrough ; Column size: 6.0 mm ID \times 4.0 cm; Sample: BSA (1.0 g/L) in 0.05 mol/L Tris, pH 8.5; Flow rate: 212 cm/h; Detection: UV @ 280 nm

Good mass transfer kinetics enable the resin to maintain DBC at faster linear velocities (Figure 12). This fast uptake ability, when coupled with the narrow elution peak typical of TOYOPEARL GigaCap resins, results in smaller and more concentrated in-process pool volumes, thus reducing the amount of water for injection needed and increasing process throughput downstream.

TOYOPEARL GigaCap DEAE-650M is base stable for at least 100 cleaning-in-place (CIP) cycles with 0.5 mol/L NaOH, making multiple uses of the resin possible (Figure 12).

CIP STABILITY OF TOYOPEARL GigaCap DEAE-650M

Alkaline washing solution: 0.5 mol/L NaOH;

Buffer washing solution: 0.5 mol/L Tris, 0.5 mol/L NaCl, pH 8.5; Flow rate: 106 cm/hr (0.5 mL/min); Alkaline wash volume: 27 CV/cycle; Alkaline contact time: 1 hr; Buffer wash volume: 10 CV/cycle
